

LINE SPLICE USING BARB AND RECEIVER

ABSTRACT OF THE DISCLOSURE

A splice system and method for linear connection of fishing lines include a female
5 connector and a male connector. Each connector has first and second opposite ends and a
longitudinal axis, about which the connector is symmetric. The first end of the female
connector is connected to a first fishing line section and the second end has a first opening; the
connector has an interior feature with a radial extent. The second end of the male connector is
connected to a second fishing line section and the first end has a projection configured for
10 coaxial insertion into the first opening of the female connector. The projection has a radial
extent greater than the radial extent of the interior feature of the female connector. At least
one of the connectors is resilient so that the projection compresses or the interior feature
expands.
